local min
triangular = local max of E_{zp}
$a \in (0.3767, 1.5815)$
local min
gauss:0.5, gauss:1
refuted by a stable
competitor
open marker: $a = 0.1$
$c(a) = \Delta E_{zp}(\rho)/4$
the sign of $\Delta\langle \mathrm{tr}\, D\rangle$ differs from
the sign of c on about $(0.12, 0.38)$
and $(1.09, 1.58)$
$\Delta(\mathrm{tr}\, D)(\rho)$ (exact lattice sum)
Gaussian width parameter a in $V = e^{-\pi a r^2}$
